Guide

How the platform works, step by step, and where each integration is needed.

1. What this platform does

Lead Platform helps you find business leads and reach them. It works in five steps: you search Google Maps or LinkedIn, the Chrome extension saves the details into your private list, the platform cleans and de-duplicates them, you send email and WhatsApp campaigns from your own accounts, and replies and opt-outs come back into the panel.

The public website: what the platform does, pricing and contact

1. Find: search Google Maps (businesses) or LinkedIn (people) yourself — or paste your own list in Quick Send.
2. Save: the Chrome extension saves what the page shows into your account.
3. Organise: duplicates are skipped; filter by city, category, tag or date added; export to CSV/Excel.
4. Reach: email and WhatsApp campaigns sent from your own Resend/SMTP and Meta WhatsApp accounts.
5. Follow up: opens, clicks, replies and opt-outs are recorded; the AI Inbox helps you answer chats.

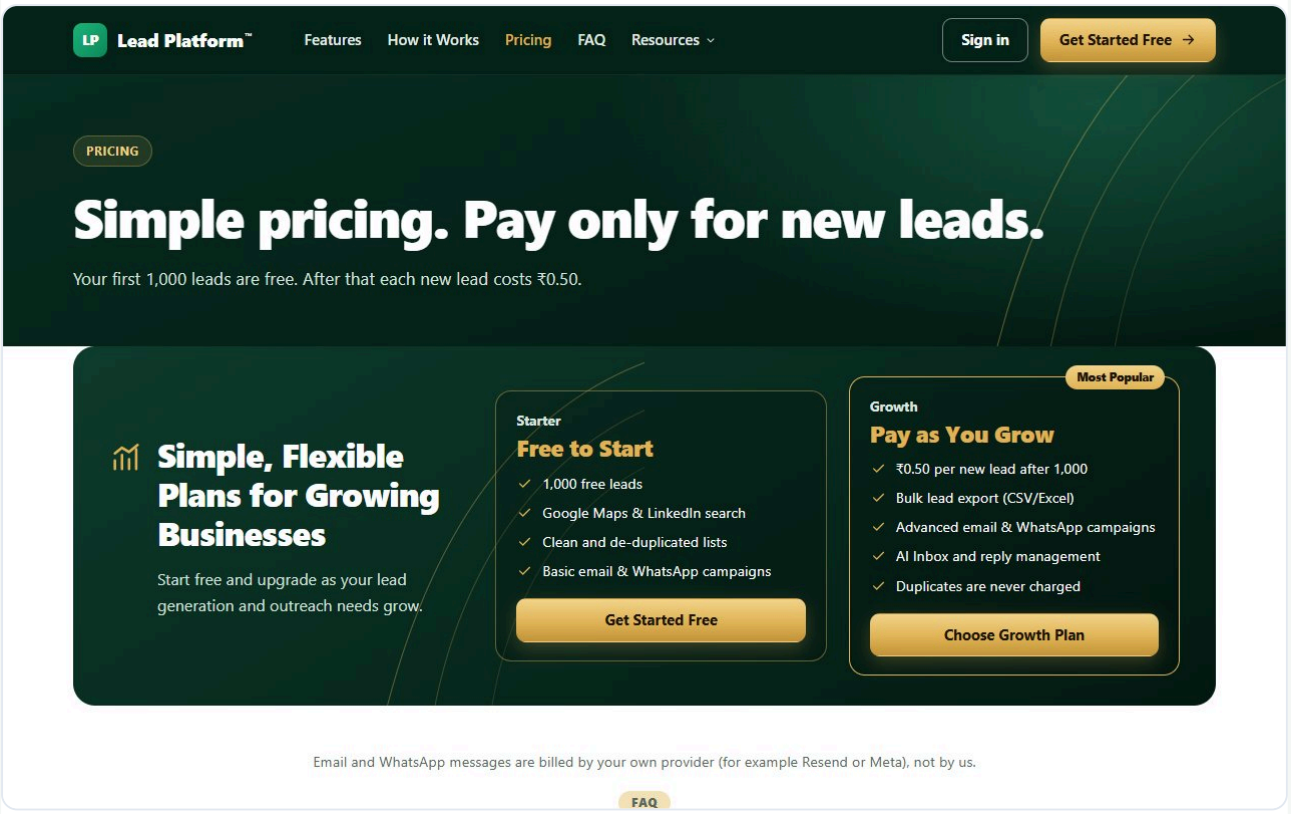

Every account is private: you see only your own leads, campaigns and settings.

2. What you need before you start

You need	For	Required?
An approved account	Signing in to the panel and the extensions	Always
Google Chrome on a computer	The Maps Data Collector and LinkedIn Helper extensions	To collect leads
Your own Resend account (or SMTP mailbox)	Sending email campaigns	For email
Your own Meta WhatsApp Business (Cloud API) number + approved templates	Sending WhatsApp campaigns	For WhatsApp
Claude or Gemini API key, Telegram bot	AI replies in the AI Inbox	Optional
Your Facebook / Instagram / LinkedIn login	Chats from your pages in the AI Inbox	Optional

Details for each integration are in “Where each integration is needed” below.

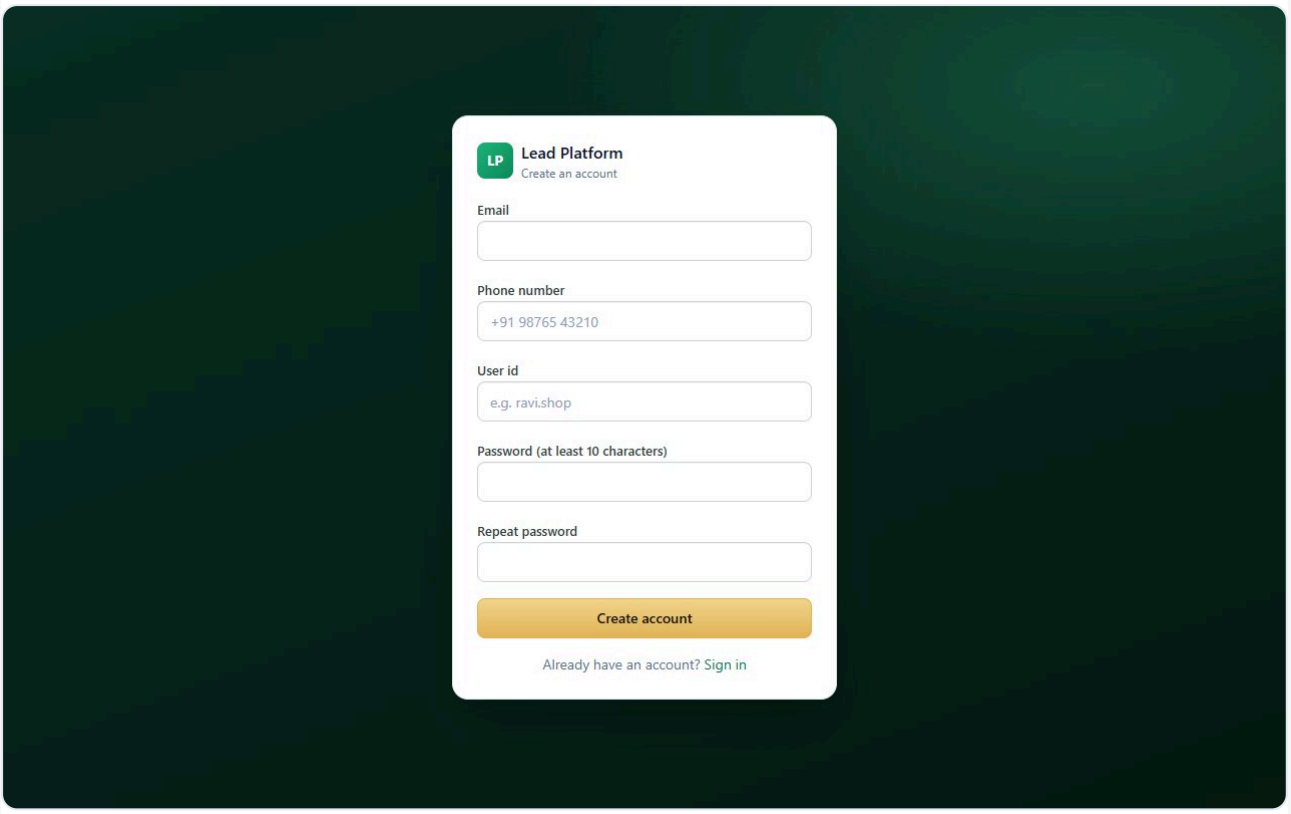

3. Pricing

Pricing page

1. Your first 1,000 leads are free (Google Maps and LinkedIn together).
2. After that each new lead costs ₹0.50. Saving a lead you already have is free.
3. Email and WhatsApp messages are billed by your own provider (Resend, Meta…), not by the platform.

4. Create your account and sign in

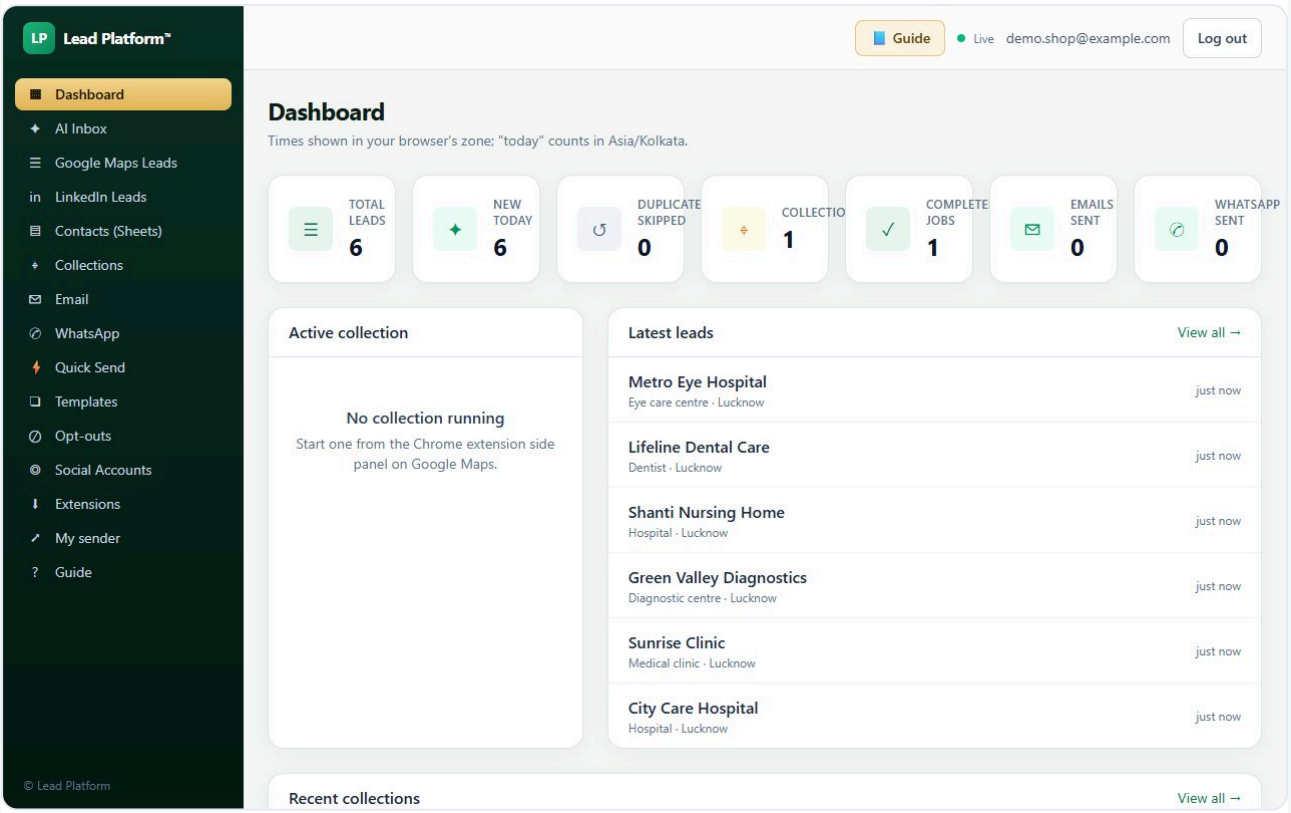

Create an account: email, phone, user id and password

1. Open the website and click “Get Started Free” (or “Create an account” on the sign-in page).
2. Enter your email, phone number, a user id (e.g. ravi.shop) and a password of at least 10 characters.
3. Your account waits for approval by the administrator. You get access once it is approved.
4. Sign in with your email or your user id and your password.

Forgot your password? Ask the administrator to reset it from the Users page.

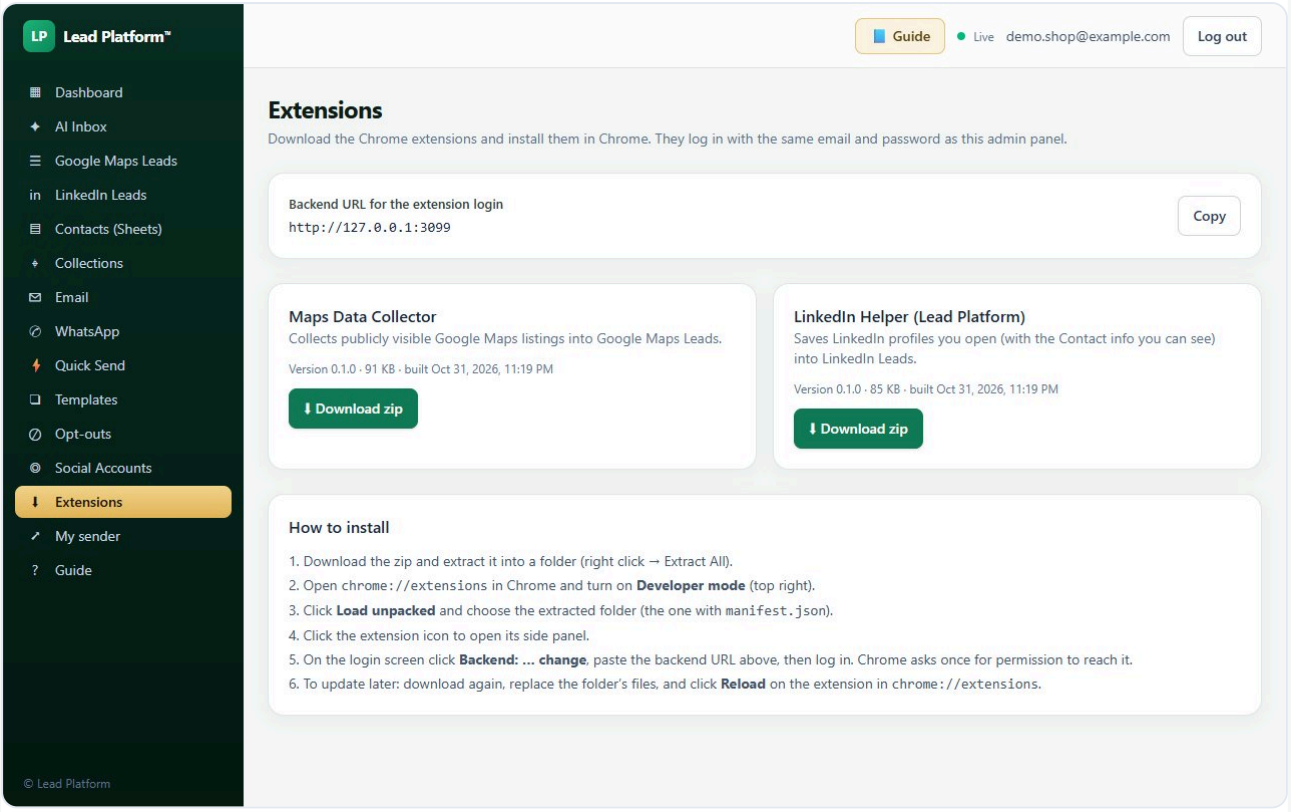

5. The dashboard

After signing in you see your totals: leads, new leads today, duplicates skipped, collections, and the latest leads and collections. The menu on the left shows only the services enabled for your account; it scrolls when it is longer than the screen. The “Guide” button at the top of every page opens the part of this guide for that page.

Dashboard after sign-in

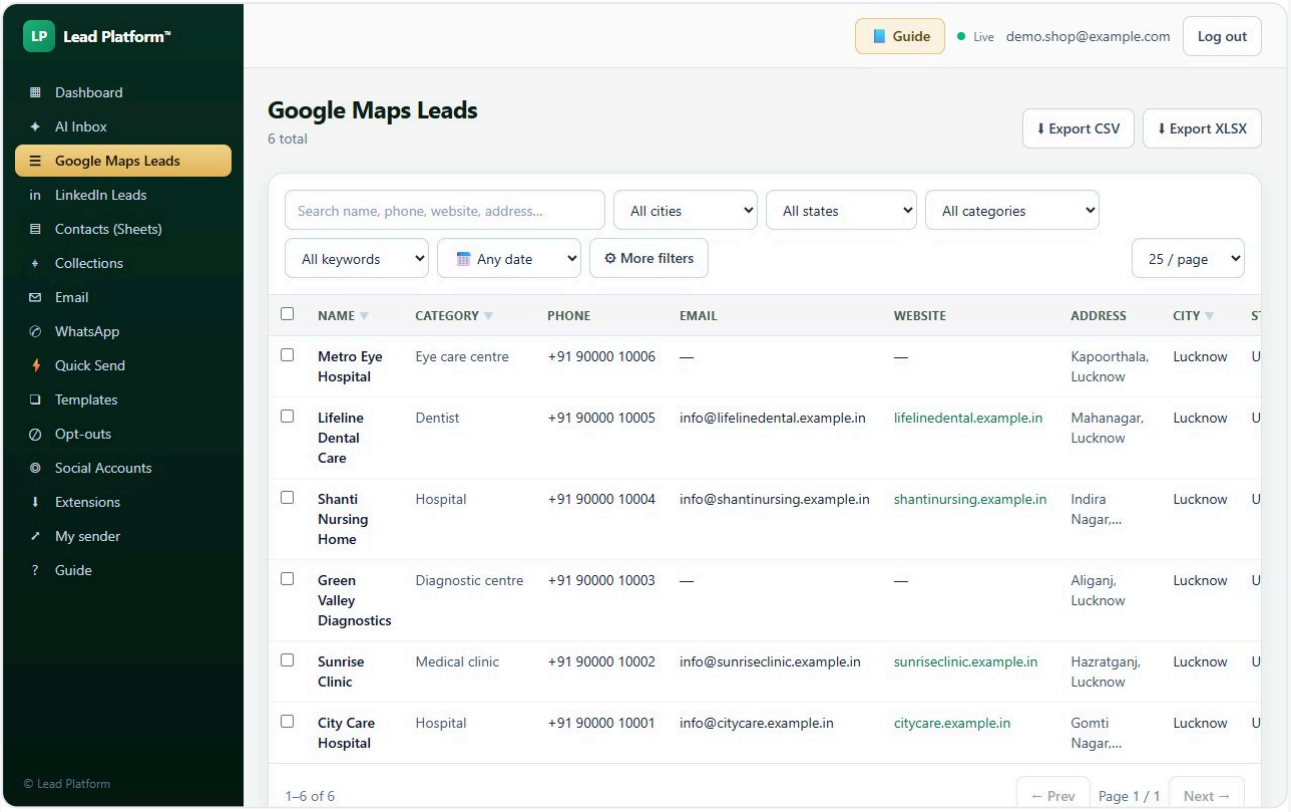

6. Install the Chrome extensions

Extensions page with download buttons and the backend URL

1. Open Extensions in the menu and click “Download zip” for Maps Data Collector (Google Maps) and/or LinkedIn Helper.
2. Extract the zip into a folder (right click → Extract All).
3. In Chrome open chrome://extensions and switch on Developer mode (top right).
4. Click “Load unpacked” and choose the extracted folder (the one with manifest.json).
5. Click the extension icon to open its side panel. On the login screen click “Backend: … change”, paste the Backend URL shown on the Extensions page (for example https://lead.the360tech.com), then sign in with your email or user id and password.
6. To update later: download again, replace the files in the folder and click Reload on the extension in chrome://extensions.

7. Collect Google Maps leads

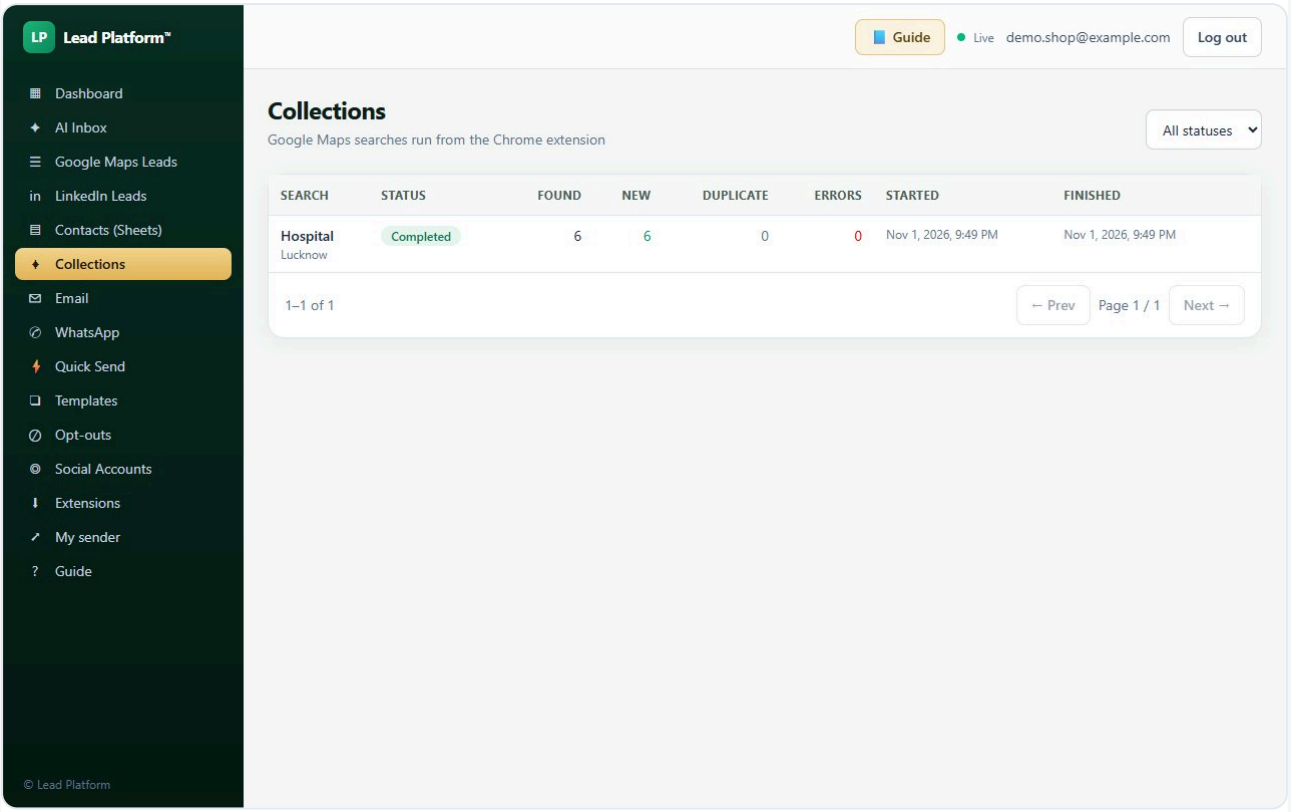

Google Maps Leads list with filters, date filter and export

1. Open google.com/maps in Chrome and open the Maps Data Collector side panel.
2. Type what you want (e.g. “hospitals in Lucknow”) and start a collection. The extension saves the listings that Maps shows: name, category, phone, website, address, rating.
3. Duplicates are skipped automatically, also across collections.
4. Google Maps Leads: search, filter by city, state, category and keyword, and use the date filter (Today, Yesterday, Last 7 / 30 days, This month or a custom range). “More filters” adds phone, email, website, rating and reviews.
5. Select rows or use the filters and click Export CSV / Export XLSX — the export uses the same filters. Selected rows can go straight into an email or WhatsApp campaign.

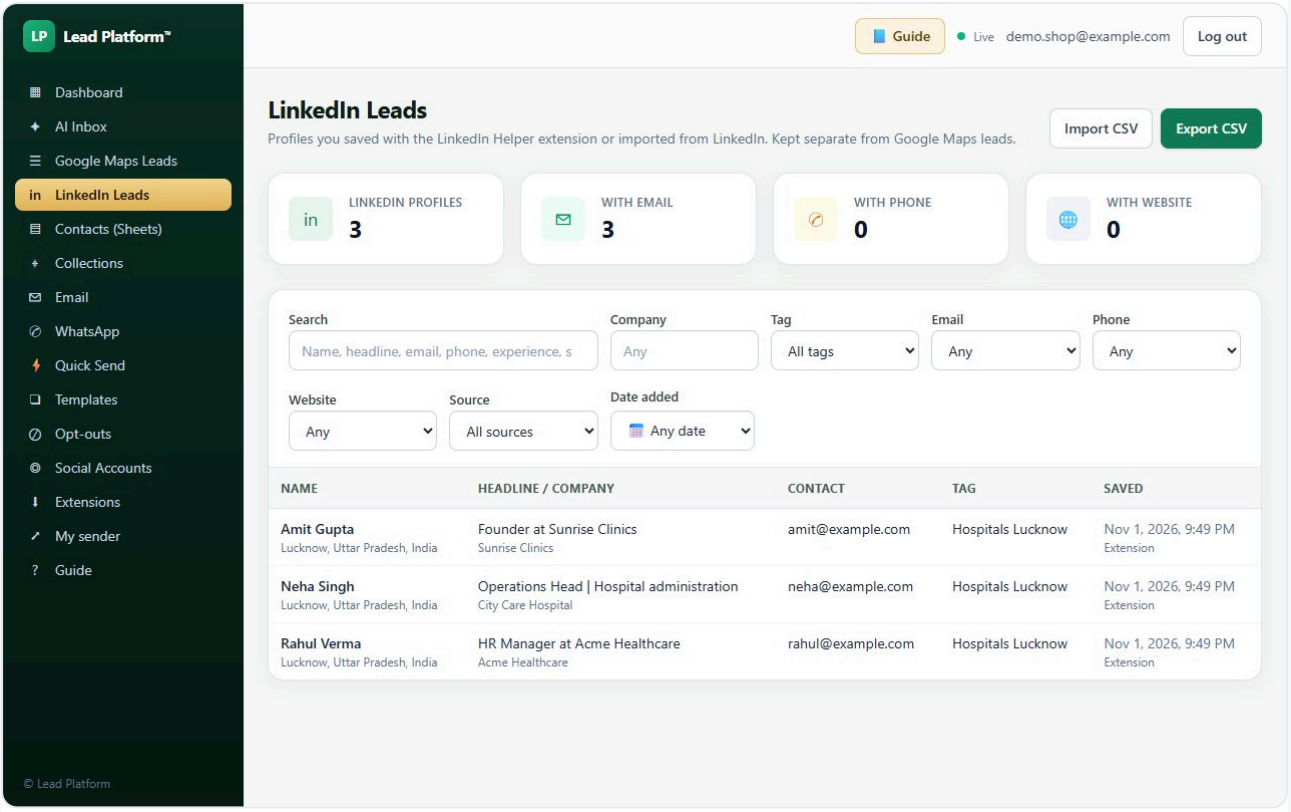

8. Collections

Every search you run with the extension is a collection. Open one to see which leads it found and its activity log.

Collections: one row per search

9. LinkedIn leads

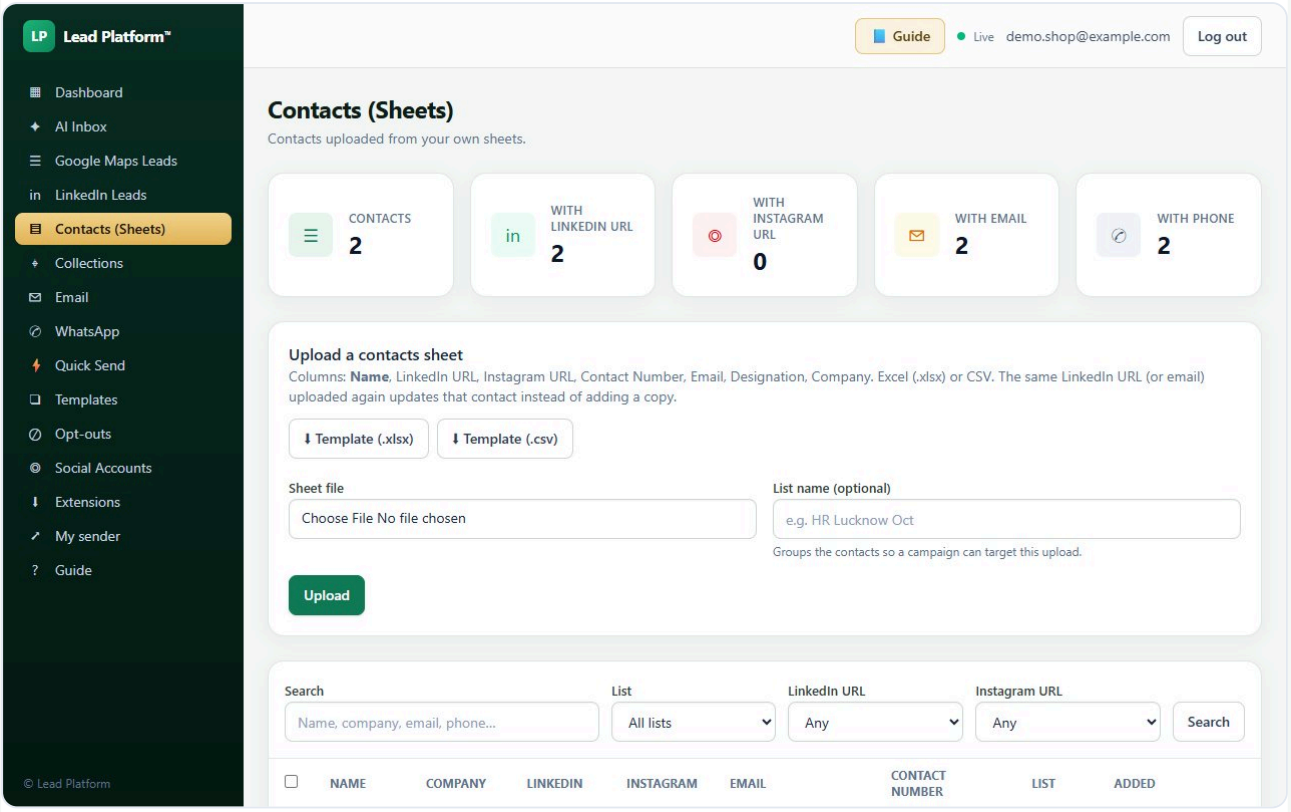

LinkedIn Leads with filters, import and export

1. With LinkedIn Helper: search on LinkedIn yourself, add the profiles of a results page to your list, open each profile and click “Save & open next” (shortcut Alt+N). The helper reads only what the open profile shows you, including Contact info you are allowed to see.
2. With a file: LinkedIn → Settings → Data privacy → Get a copy of your data → Connections. Upload Connections.csv with Import CSV.
3. Filter by company, tag, email, phone, website, source and date added, and export to CSV.

Keep a human pace (the helper shows a daily limit); LinkedIn may restrict accounts that open too many profiles.

10. Contacts (Sheets)

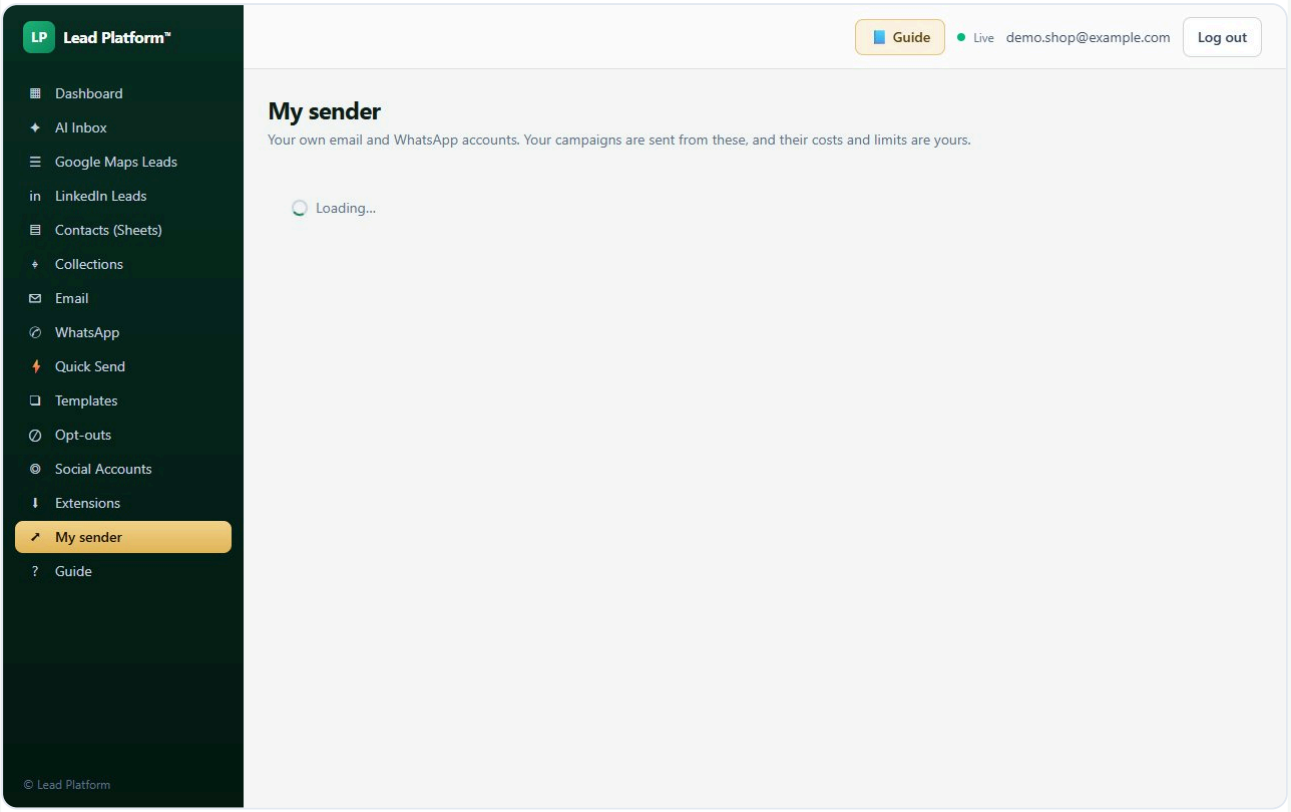

Contacts uploaded from a sheet

1. Download the template (CSV or Excel), fill in Name, LinkedIn URL, Contact Number, Email, Designation and Company, and upload it with a list name.
2. Uploading the same people again updates them instead of adding duplicates.
3. Search and filter by list, company or designation; delete what you no longer need.

11. Connect your own sender (email and WhatsApp)

Campaigns are sent from your own accounts. Open My sender and connect at least one. Keys are stored encrypted and never shown again.

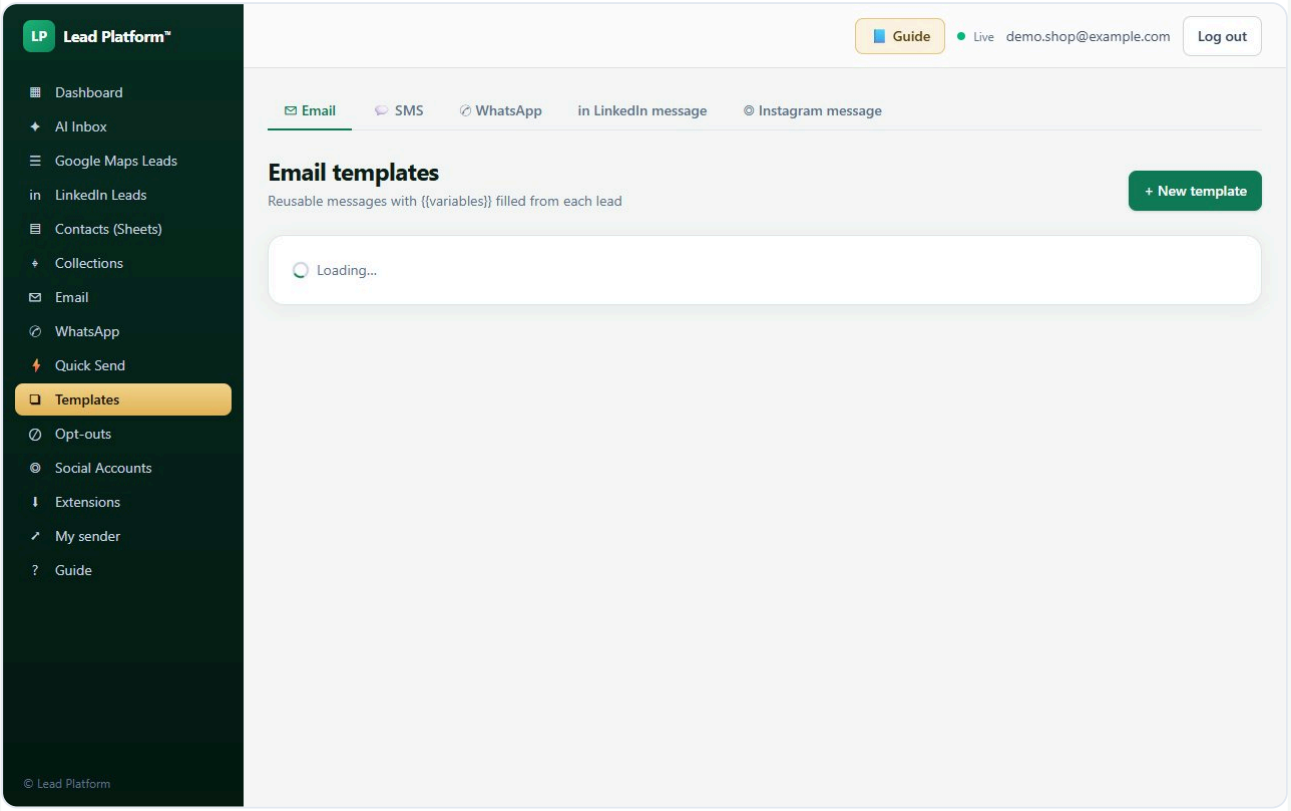

My sender: your own email and WhatsApp accounts

1. Email with Resend: create an account at resend.com, verify your domain (add the DNS records it shows), create an API key (starts with re_). Enter From (e.g. Your Shop <hello@yourshop.in>) and the API key, then Save.
2. Resend tracking (optional): in Resend → Webhooks add the endpoint URL shown on My sender and copy its signing secret (starts with whsec_) into “Webhook signing secret”.
3. Email with SMTP instead: enter host, port (587 or 465), user and password. For Gmail use smtp.gmail.com and an App Password (Google Account → Security → App passwords).
4. WhatsApp: in Meta for Developers create an app with WhatsApp, add your business phone number, create a permanent System User token, and copy the Phone number ID. Enter both and Save.
5. WhatsApp replies and opt-outs (optional): in the Meta app → WhatsApp → Configuration set the Callback URL shown on My sender, use the verify token you chose, and subscribe to messages.
6. Click “Send test email” / “Send hello_world test” to check the connection.

12. Templates (email and WhatsApp)

Write reusable messages. Variables such as {{name}} and {{city}} are filled from each contact. Every email automatically gets an unsubscribe link. WhatsApp templates must be approved by Meta first; add them under WhatsApp → Templates with the same name, language and category as in Meta.

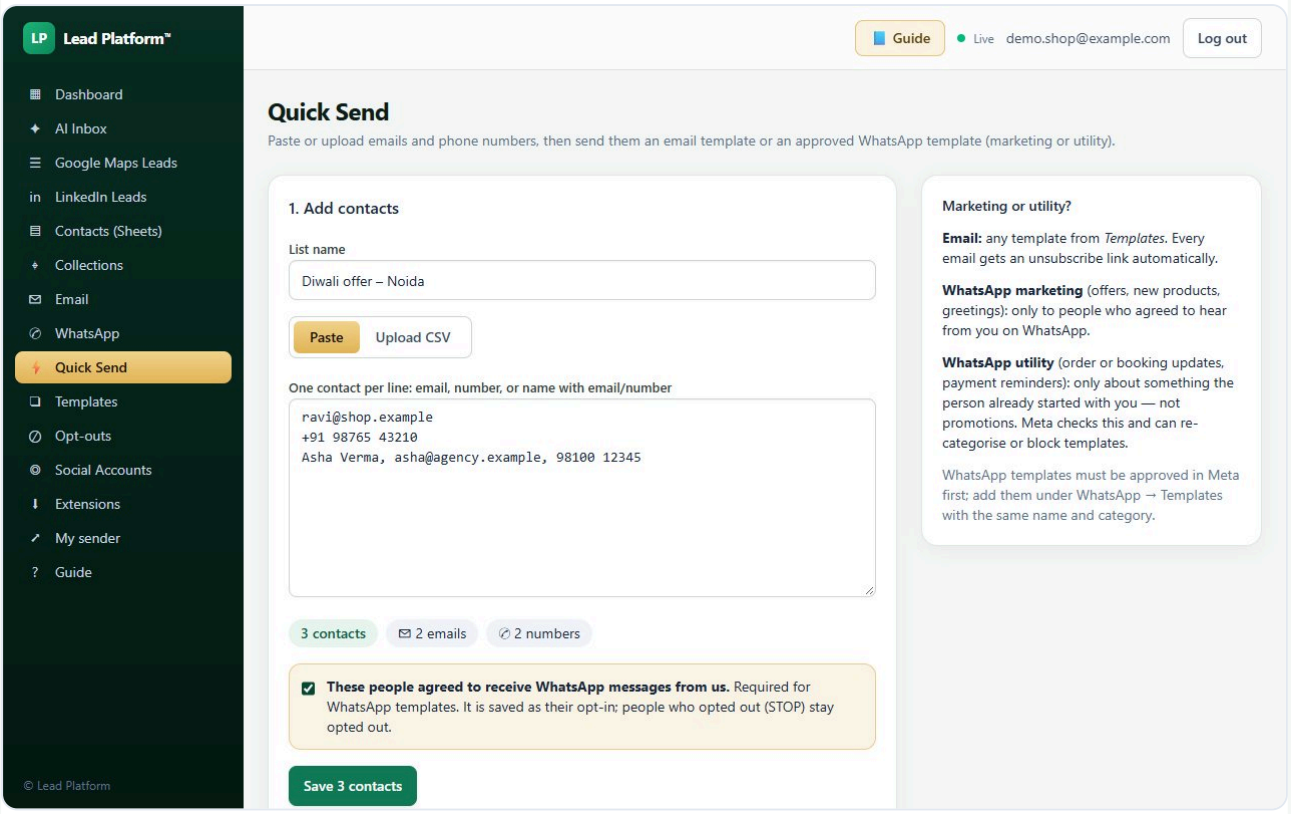

Email templates with variables

WhatsApp category	Use it for	Who may receive it
Marketing	Offers, new products, greetings, newsletters	Only people who agreed to receive WhatsApp messages from you
Utility	Order / booking updates, payment reminders, account alerts	Only about something the person already started with you — never promotions

Meta reviews every template and can re-categorise or reject it. Sending marketing messages without consent can get your number blocked.

13. Quick Send: your own emails and numbers

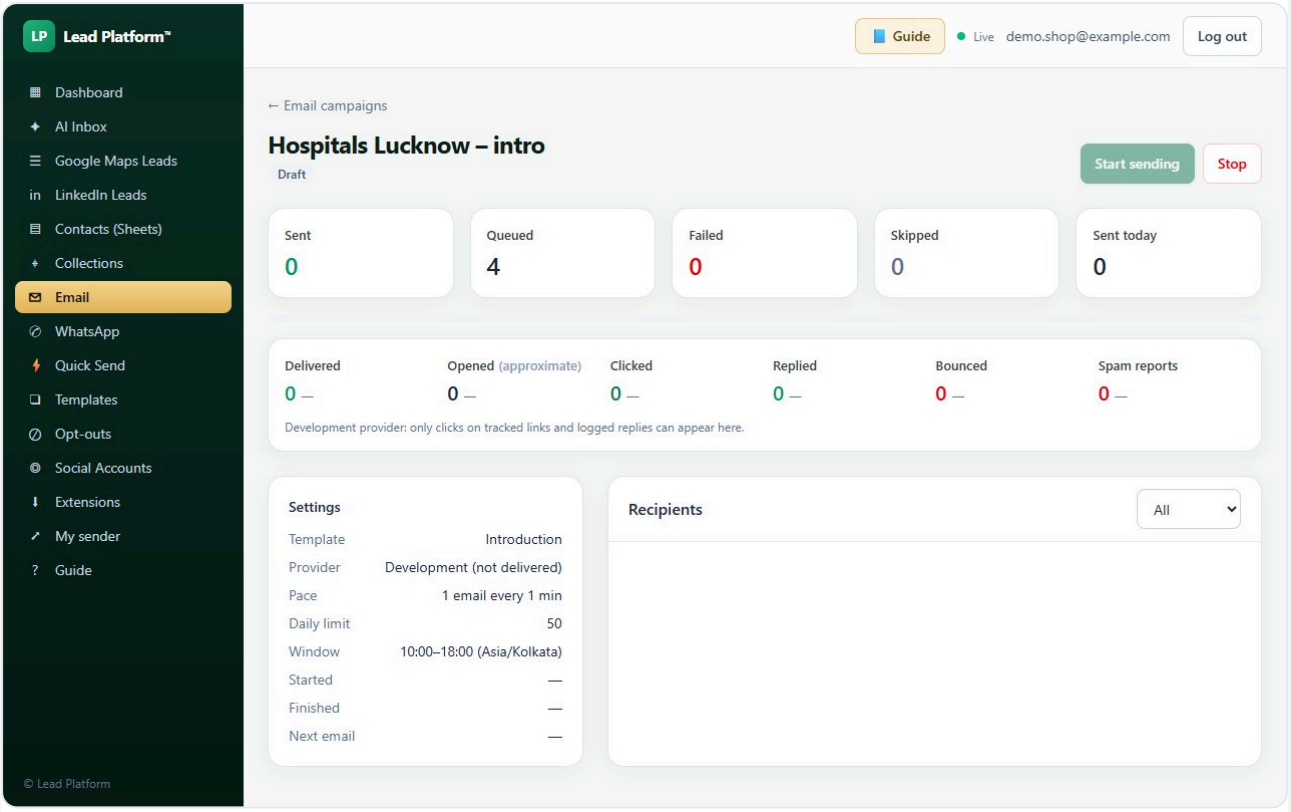

Quick Send: paste or upload contacts, then send a template

1. Open Quick Send and give the list a name (e.g. “Diwali offer – Noida”).
2. Paste one contact per line — an email, a number, or a name with email/number (“Asha Verma, asha@agency.in, 98100 12345”) — or upload a CSV with Name, Email and Phone/Mobile columns (from Excel: Save as → CSV). Up to 5,000 at a time.
3. For WhatsApp, tick “These people agreed to receive WhatsApp messages from us”. It is saved as their opt-in; anyone who replied STOP or opted out stays excluded.
4. Click Save contacts. Rows with a wrong email or number are listed with the reason; contacts you already have are reused, not duplicated.
5. Click “Send email template” or “Send WhatsApp template”. The campaign form opens with these contacts selected: choose the template (WhatsApp shows Marketing / Utility), pace and daily limit, then Start.

Quick Send contacts also appear under Google Maps Leads with category “Quick Send” and the list name as keyword, where you can filter and export them.

14. Email and WhatsApp campaigns

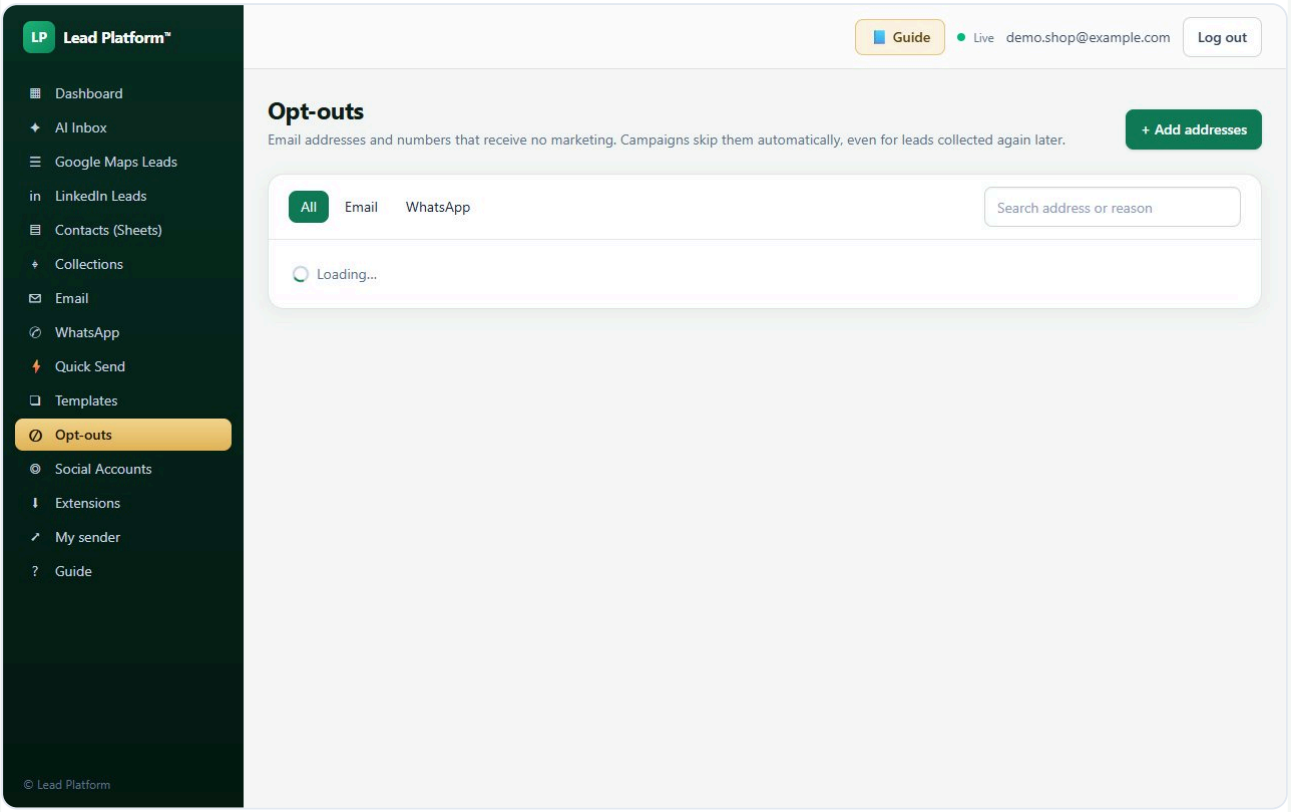

An email campaign with its pace, window and recipients

1. Email → New campaign: choose a template, pick recipients (filters, selected leads or a Quick Send list), set the pace (one message every N minutes), a daily limit and the sending window.
2. Leads without an email address, opted-out addresses and repeated addresses are left out automatically.
3. Click “Start sending”. You can pause, resume or stop at any time.
4. The campaign page shows sent, failed, delivered, opened, clicked, replied and bounced.
5. WhatsApp campaigns work the same way with an approved template; only contacts with a recorded opt-in receive messages.

Start sending is available once your sender for that channel is connected (see “Connect your own sender”).

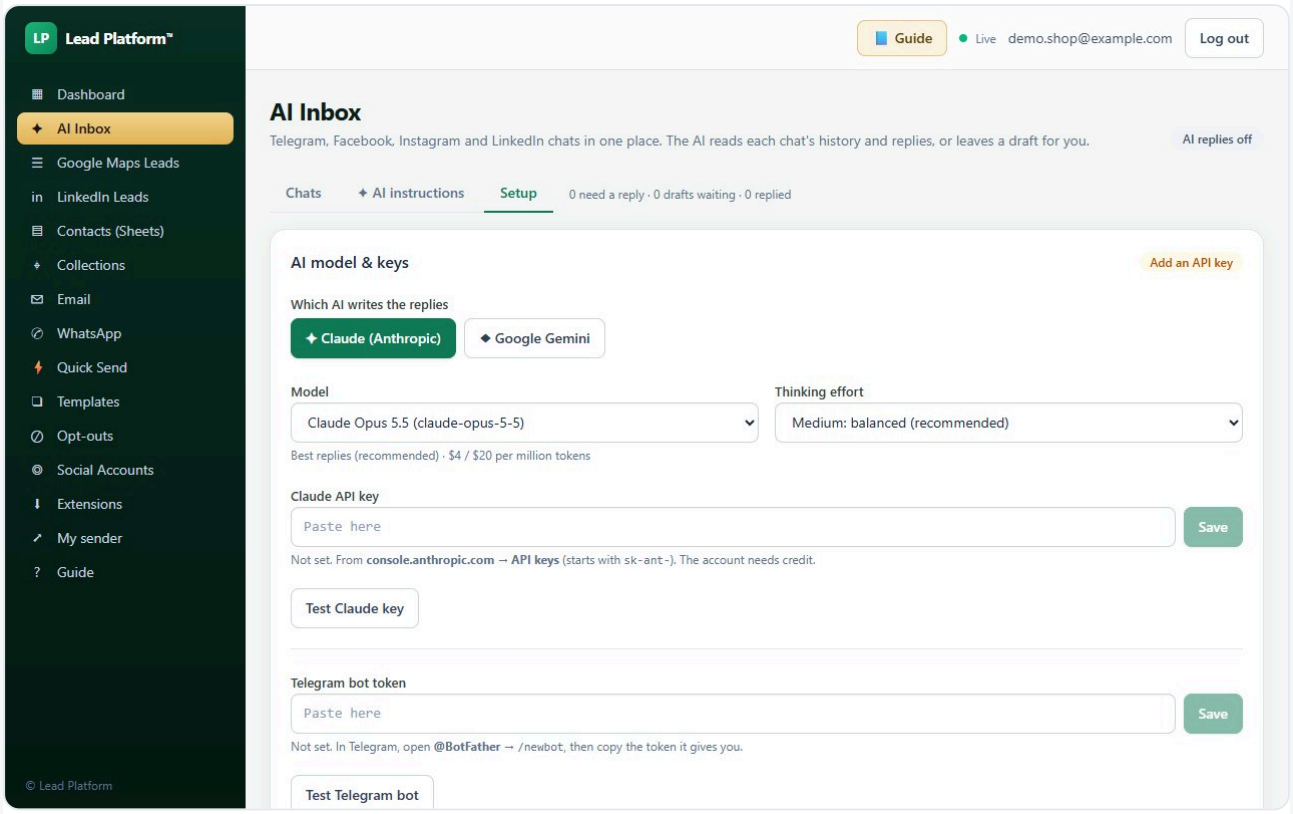

15. Opt-outs

Unsubscribes, STOP replies and spam reports are added automatically. You can add addresses yourself (one per line). Campaigns never message an address on this list, even for leads collected or pasted again later.

Opt-out list

16. AI Inbox

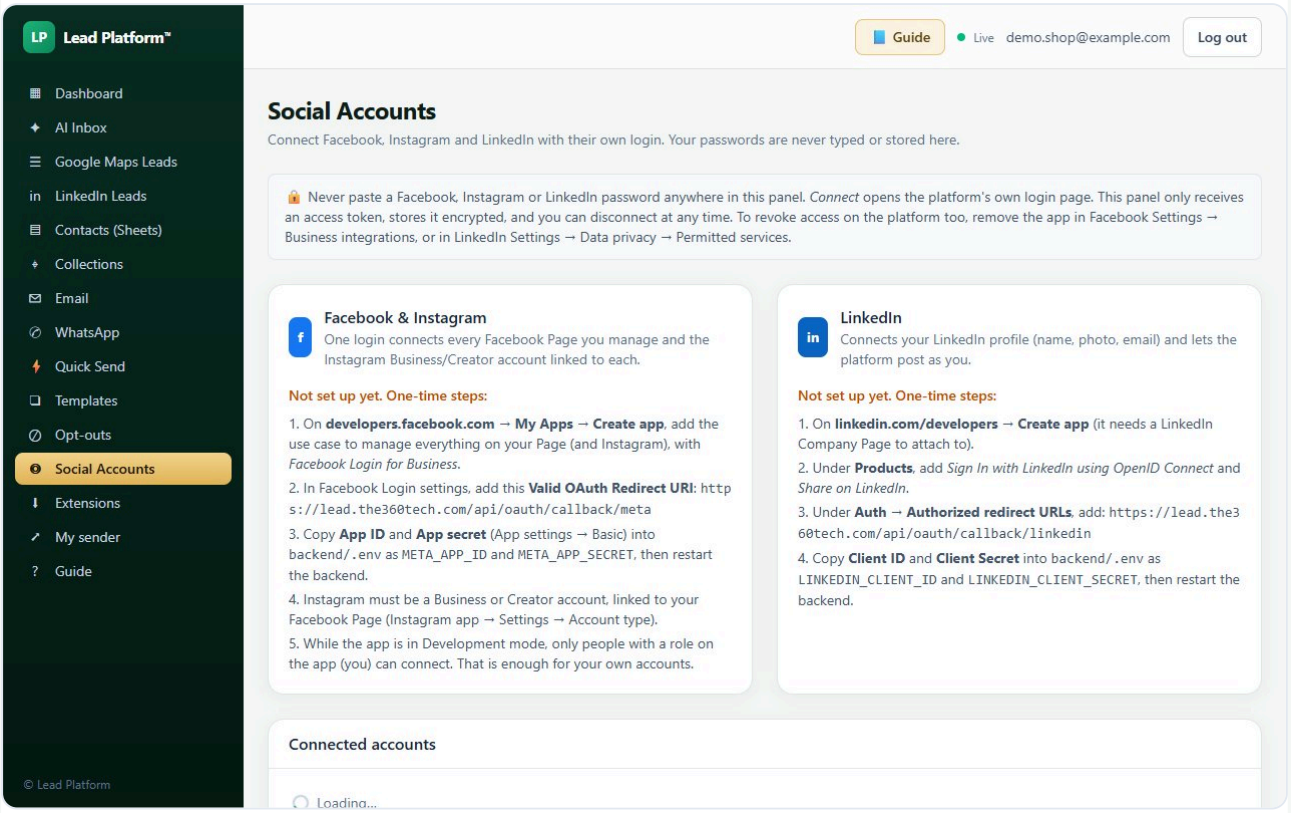

AI Inbox → Setup: AI model, API key and Telegram bot

1. Setup → choose Claude (Anthropic) or Google Gemini and paste your API key: Claude from console.anthropic.com → API keys (starts with sk-ant-); Gemini from aistudio.google.com → Get API key.
2. Telegram: open @BotFather in Telegram, send /newbot, and paste the token it gives you.
3. AI instructions: describe your business, prices, FAQs, tone and topics the AI must leave to you.
4. Choose per app whether the AI replies on its own, only drafts replies for your approval, or stays off.
5. Facebook and Instagram chats appear after you connect your accounts (see “Social accounts”).

17. Social accounts

Click Connect: Facebook or LinkedIn opens its own login page; you never type your password into this panel. The platform receives an access token, stores it encrypted, and you can disconnect at any time.

Connect Facebook, Instagram and LinkedIn

The Connect buttons work once the administrator has set up the platform's Facebook and LinkedIn apps (see the server settings section).

18. Where each integration is needed

Integration	Needed for	Where to get it	Where to enter it
Chrome (desktop)	Collecting leads with the extensions	google.com/chrome	Extensions page → download → Load unpacked
Resend	Sending email campaigns (recommended)	resend.com → API keys (verify your domain)	My sender → Email (Resend)
SMTP (Gmail, Zoho…)	Sending email without Resend	Your mail provider (Gmail: App password)	My sender → Email (SMTP)
Meta WhatsApp Cloud API	WhatsApp campaigns and Quick Send, replies, STOP	developers.facebook.com → app with WhatsApp	My sender → WhatsApp
WhatsApp templates (Marketing / Utility)	Every WhatsApp campaign	Meta Business Manager → WhatsApp Manager → Message templates	WhatsApp → Templates (same name, language, category)
Claude or Gemini API key	AI replies in the AI Inbox	console.anthropic.com / aistudio.google.com	AI Inbox → Setup
Telegram bot	Telegram chats in the AI Inbox	@BotFather in Telegram	AI Inbox → Setup
Facebook / Instagram / LinkedIn	Page and Instagram chats, LinkedIn profile	Your own accounts (login via Connect)	Social Accounts → Connect
Meta & LinkedIn developer apps	Makes the Connect buttons work	developers.facebook.com, linkedin.com/developers	Server settings (administrator)

19. Troubleshooting

Problem	What to do
“Your account is waiting for approval”	The administrator has not approved it yet. Contact them.
The page still looks old after an update	Reload with Ctrl+F5 to load the new version.
Extension says it cannot reach the backend	Check the Backend URL on the extension's login screen (copy it from the Extensions page) and allow the permission Chrome asks for.
“This service is not enabled for your account”	Ask the administrator to switch the service on for you.
Start sending is greyed out	Connect your sender on My sender and send a test.
WhatsApp campaign says 0 recipients	Contacts need a recorded opt-in (tick the consent box in Quick Send) and an approved template.
Campaign paused with a setup message	Open the campaign; fix the reason shown (sender, template approval) and resume.
